MURS WIRELESS SYSTEM

Use the Best Kept Secret in Unlicensed Two-Way Radios and Wireless Intercoms to Improve your Home or Business Communication.

Use the Best Kept Secret in Unlicensed Two-Way Radios and Wireless Intercoms to Improve Your Business Communication.

Businesses often have communication problems that cannot be effectively solved with the use of cell phones or wired telecommunication systems. Two-way radio technology has the solution to these problems, but up until now you had to either use overly crowded non-licensed radios with lots of chatter from kids, or you had to go through the cumbersome process of getting a license from the FCC. Now there is a group of frequencies and products available for them that have been the best kept secret of two way radios and wireless intercoms since their introduction. The FCC released these frequencies in 2000, but there are still few radios available and usage is very light.

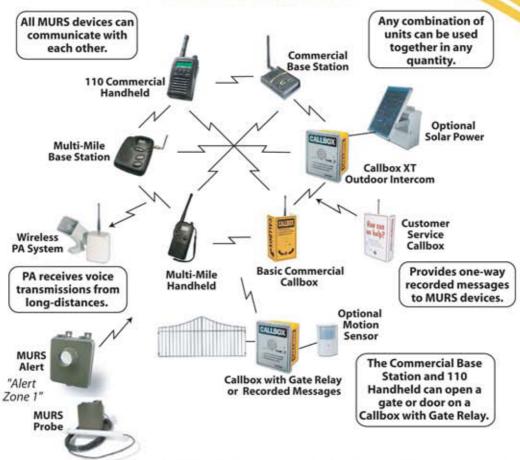

This group of frequencies is called MURS (rhymes with furs), which is short for Multi-Use Radio Service. Any manufacturer can create compatible products for MURS, and what you'll find here are the products currently available you can use to solve your business communication problems. And you won't have to get an FCC license to do it.

MURS devices consist of wireless base station intercoms, handheld two-way radios, wireless public address units, customer service callboxes, wireless remote switches, and wireless callboxes with or without gate opening ability. Use them to put clear wireless voice communication anywhere you need it, quickly, without expensive trenching, wiring costs, and monthly air-time fees. MURS wireless radios can be installed anywhere in literally minutes.

With MURS radios range is measured in miles, not feet. MURS has a power increase of four times that of commonly available unlicensed radios. Unlike these other radios, you can also add a larger or external antenna to improve range. The antenna can be mounted as high as 60 feet.

MURS has 5 channels and 38 privacy codes enabling you to pick up only conversations from radios transmitting your privacy code. If you have existing licensed two-way radios, most of the radios shown here are available in licensed VHF and UHF frequencies as well.

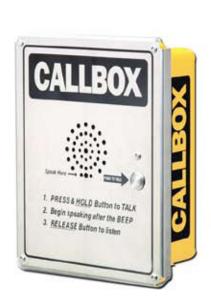

MURS Wireless Radios

MURS Radios are used for:

parking lots security gates college campuses airports hospitals construction sites manufacturing facilities resorts hotels farms warehouses delivery docks and doors campgrounds marinas country clubs gated communities construction sites amusement parks
